xero

XERO X HELIUS

The agentic operating system for Solana builders.

Deep LanaAI integration. Bundled Helius infrastructure credits. One subscription for the complete local-to-mainnet agent workflow.

- local-first
- agent-native
- Solana-maximalist

fork	surfpool mainnet-fork · personas seeded
build	solana_tx_build → compute budget tuned
inspect	LanaAI explains account flows + wallet history
land	Helius Sender + priority fee estimate
audit	IDL drift, Trident fuzz, exploit replay

78
registered Solana Tauri commands

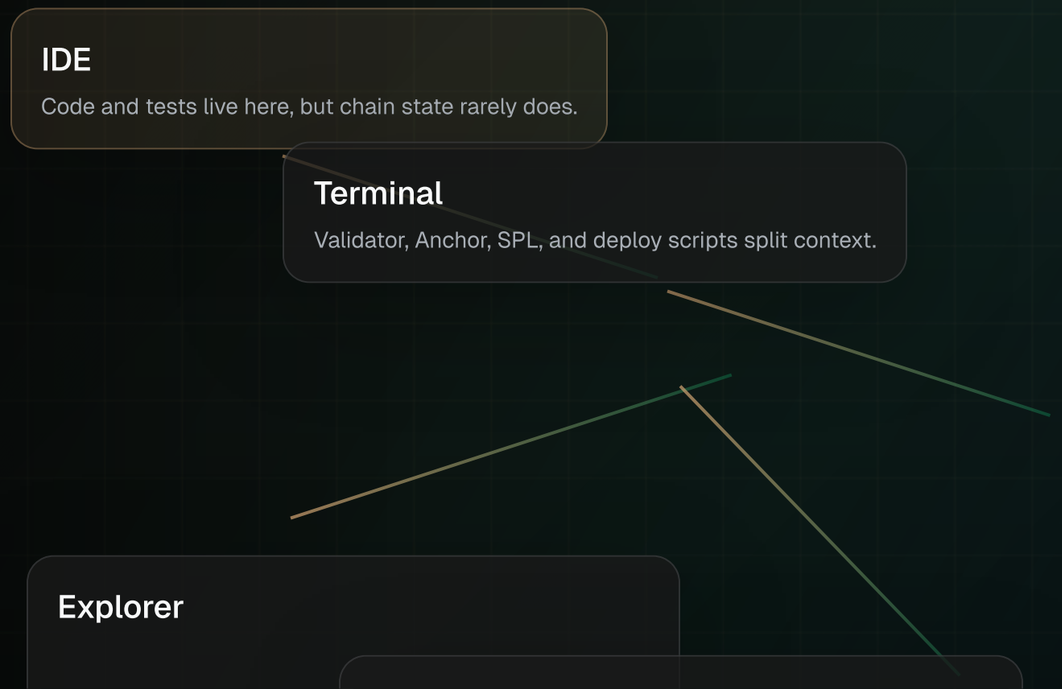
1
shared UI + agent command surface

90
day pilot proposal

THE GAP

The Solana dev stack is powerful, but fragmented.

Helius and LanaAI are world-class at infrastructure and exploration. The missing layer is the environment where a builder's agent can keep repo context, chain context, and deploy safety in one loop.



01 **Agents lose working memory between tools.**
A tx failure starts in code, moves through logs, then into a browser or chat. By the time the answer arrives, the agent has lost the full state.

02 **Local simulation and production infra are disconnected.**
Builders fork, seed, simulate, and audit locally, then rewire everything when they need reliable mainnet reads and sends.

03 **Subscriptions multiply before velocity does.**
RPC, explorers, indexers, cloud agents, wallet tooling, and deploy safety are bought as separate tools with separate support paths.

THE PRODUCT MOVE

Xero + LanaAI + Helius becomes the default stack.

Xero / squads-liquidator · main

PROJECT

- src/
  - programs/
    - liquidator.rs
  - tests/
    - whale-flow.ts

WORKBENCH

- Personas
- Tx inspector
- Deploy safety
- Audit replay

Surfpool mainnet-fork
slot 331,804,110 · 3,891 TPS · 5 personas

ready

build	solana_tx_build · v0 tx + ALT hints	ok
simulate	auto CU limit 384k · fee percentile high	ok
inspect	lana_query whale wallet, token flow, risk context	ok
gate	IDL drift clean · Squads authority verified	ok
send	land via Helius Sender + priority fee API	queued

LanaAI live

Show me large transfers from this whale before the failed liquidation tx.

3 related transfers detected. The failing tx writes to the same collateral PDA and likely needs an extra oracle account.

Helius credit pool 62%

Auto top-up enabled. Public RPC fallback stays available for non-critical reads.

One workflow

Code, fork, inspect, audit, deploy, and monitor stay in the same agent run.

One surface

The UI and autonomous runtime call the exact same Tauri commands.

One account

Solana Pro bundles the infra spend builders already need.

WHAT XERO ALREADY HAS

This is not a speculative workbench.

The repo already contains a first-class Solana sidebar, a Rust command surface, local persistence, provider profiles, notification routing, and a Tauri backend designed for agent-callable workflows.

78

registered `solana_*` commands wired through the Tauri app.

DESKTOP SUBSTRATE

Rust + Tauri core

React/Vite frontend, Rust backend orchestration, local SQLite persistence, ShadCN/Radix/Tailwind UI.

CLUSTERS

Local to forked mainnet

Toolchain probes, managed install flow, localnet/mainnet-fork lifecycle, snapshots, RPC health, cost ledger.

PERSONAS

Seeded actors

Whale, LP, voter, liquidator, new user, custom keypairs, SOL/SPL/NFT funding receipts, scenario runs.

TX PIPELINE

Build, simulate, land

Priority fee estimates, compute-budget plans, ALT helpers, CPI resolver, decoder, Jito transport hooks.

DEPLOY SAFETY

IDL and upgrade gates

Codama generation, IDL fetch/publish/drift, program build, upgrade checks, Squads proposals, verified builds.

SECURITY LOOP

Audit and replay

Static lints, Trident fuzzing, coverage, exploit replay library, PDA scans, secret scans, cluster drift.

Project evidence: README, SOLANA_WORKBENCH_PLAN.md, client/src-tauri/src/lib.rs command registration, and Solana workbench source tree.

INTEGRATION THESIS

LanaAI becomes the embedded intelligence layer for every Solana run.

LanaAI replaces static exploration with conversational on-chain reasoning. Xero puts that reasoning inside the builder's live repo, validator, tx pipeline, and deploy gate.

01 Tx Inspector + Decoder

After simulation or failure, Xero sends signature, logs, IDL, writable accounts, and persona context to LanaAI for a plain-English trace.

02 Audit + Exploit Replay

AuditEngine asks LanaAI for related attack patterns, historic account flows, and explainable replay notes before a risky deploy.

03 Deploy Safety Gate

Program upgrade checks can query LanaAI for authority history, recent program activity, suspicious token flows, and IDL drift context.

04 Persona + Scenario Seeding

Builders describe a market, wallet, protocol, or incident. Xero turns it into funded personas and fork-ready scenarios backed by LanaAI context.

For Helius: every Xero Solana session becomes a LanaAI power session. Human prompts become agent loops, and agent loops multiply query volume.

Sources checked: lana.ai public site and public r/solana launch post linking Mert's April 21, 2026 announcement.

BUNDLE THE INFRA WHERE THE WORKFLOW BEGINS

Make Helius the default paid rail inside Xero Solana Pro.

Free

$0
forever

Local desktop studio for builders who bring their own model and infra keys.

- Unlimited local projects
- Local autonomous runtime
- BYO model providers

Pro

$20
/ month

Cloud runtime, sync, durable background runs, and hosted run history.

- Everything in Free
- Parallel workers
- Priority support

Solana Pro

$50
/ month

Pro plus the on-chain workbench bundle for serious Solana builds.

- Workbench access
- RPC/indexer/webhook bundle
- Cost alerts and deploy safety

Partnership mechanics

Xero handles subscription UX, metering, invoicing, and L1 support. Helius provides the infra rail and wholesale credit economics.

FOR BUILDERS

- Single invoice for app + Solana infra
- Automatic top-ups and cost panels
- Priority Fee, Sender, RPC, Webhooks path
- Graceful fallback to public RPCs for non-critical work

FOR HELIUS

- New paid acquisition channel at point of creation
- Predictable wholesale volume
- Higher stickiness through daily workflow
- Path to dedicated node and enterprise upsells

Xero pricing source: landing pricing component. Helius product source: Helius docs for RPC endpoints, Priority Fee API, Sender, and Webhooks.

Agents make infrastructure usage compound.

The next Solana developer platform is not just a dashboard. It is an agentic environment that repeatedly reads, simulates, explains, sends, and monitors on-chain state.

6,000
active Solana developers reached in 2025.

3,830
new Solana developers welcomed in 2025.

10x
modeled query multiplier when agents drive exploration instead of humans clicking.

Why this window is unusually good

LANAAI	A conversational Solana explorer is live now, creating the perfect integration surface for agentic dev sessions.
AGENTS	Coding agents are moving from chat helpers to persistent workers that need reliable chain reads and tx landing.
LOCAL-FIRST	Serious builders want forked state, seeded scenarios, fast simulation, and safety checks before mainnet spend.
HELIUS	Helius already owns the trusted Solana infra layer: RPC, Sender, LaserStream, Webhooks, DAS, and fee tooling.
XERO WEDGE	Xero sits at the daily point of creation: repo, agent, terminal-equivalent tools, notifications, emulators, and now Solana.

BUSINESS MODEL AND GTM

A contained pilot that can become the default Helius workflow channel.

Revenue model

Xero SaaS	$0 / $20 / $50
Helius credit bundle	wholesale or rev-share
Team plans	seats + pooled credits
Enterprise	dedicated nodes + support
Future MCP licensing	tool surface distribution

Weeks 0-2

Contract the surface

Define LanaAI calls, credit metering, Helius account linking, privacy boundaries, and support ownership.

Weeks 3-5

Wire the pilot

Ship embedded LanaAI tx inspection, Helius credit ledger, Sender path, and Priority Fee defaults behind a beta flag.

Weeks 6-8

Run with builders

Invite top Solana teams, measure agent query volume, landing quality, workflow retention, and credit conversion.

Weeks 9-12

Co-launch

Publish docs, examples, demos, and a co-branded Solana Pro beta launch powered by Helius and LanaAI.

Pilot target: 500 qualified builders, 300 Solana Pro seats, $180k ARR run-rate, and a 3x lift in Helius credit consumption from the Xero cohort.

FOUNDER-TO-FOUNDER

Mert, LanaAI changes how builders explore Solana. The next battle is where they build for eight hours a day.

We do not want to compete with Helius. We want Xero to be the reason every serious Solana builder has a Helius account and asks LanaAI daily.

01

Distribution at the point of creation

Helius moves from infra dashboard to the default rail inside the builder's repo, tx pipeline, and deploy process.

02

Agent multiplier effect

Agents do not ask one question. They inspect repeatedly: accounts, logs, fees, histories, risks, and landing outcomes.

03

Local to mainnet flywheel

Xero starts free and local, then naturally graduates teams into Helius when reliability, speed, webhooks, and Sender matter.

04

Shared DNA

Local-first craft, Solana-native bias, infra honesty, and a preference for tools builders actually use every day.

THE ASK

Start with a focused 90-day technical pilot.

01 **Technical pilot**
LanaAI integration surface, Helius account linking, credit metering, and Sender/Priority Fee defaults.

02 **Wholesale pricing agreement**
Clear credit economics for Solana Pro, Team, and enterprise paths without asking Helius for free infra.

03 **Co-branded launch**
"Powered by Helius and LanaAI" inside Xero Solana Pro, with docs, demos, and launch content.

04 **Mutual builder intros**
Run the pilot with top Solana teams who will stress the workbench and produce credible usage data.

05 **Optional upside discussion**
Equity, rev-share, or strategic distribution terms once the pilot proves demand.

Next step

A 30-minute call this week to scope the LanaAI hooks, credit metering contract, and beta cohort. We can share the full Solana Workbench implementation plan and command surface.

Ready when you are, Mert. Let's make Solana the easiest chain to build on for agents and humans alike.
